

INSTITUTO CENTRAL METEOROLÓGICO

Año XVII

Boletín del Miércoles 17 de Noviembre de 1909

Nº 521.

Faltan muchos telegramas. — La borrasca del Atlántico ha caminado hacia el ENE con rapidez y hoy tiene su centro al SW de Galicia y un nivel de 745 mm; el secundario señalado ayer, ha seguido la misma marcha que la depresión principal, encontrándose entre las Baleares y la costa de España; el paso de este del Atlántico al Mediterráneo ha sido la causa de que las lluvias en la Península hayan sido muy copiosas (Sevilla 61 mm, Badajoz 48 mm, Córdoba 44 mm, Málaga 39 mm, Madrid 40 mm, etc). — Los vientos soplan bonancibles y frescos de dirección variable. — Las presiones más elevadas residen por el N de Europa. — La temperatura máxima de ayer fue de 20° en Murcia y la mínima de hoy ha sido de 1° bajo cero en León. —

Tiempo probable.
